RF exposure

According to FCC part 1.1310: The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency (RF) radiation as specified in § 1.1307(b)

Limits for Maximum Permissible Exposure (MPE)

Frequency range (Mb)	Electric field strength(V/m)	Magnetic field strength (A/m)	Power density (mW/cm²)	Average time		
(A) Limits for Occupational / Control Exposures						
300 – 1 500			f/300	6		
1 500 - 100 000			5	6		
(B) Limits for General Population / Uncontrol Exposures						
300 – 1 500			f/1500	30		
1 500 – 100 000			<u>1</u>	<u>30</u>		

f= frequency in Mz

Friis transmission formula: $Pd = (Pout \times G)/(4 \times pi \times R^2)$

Where,

Pd = power density in mW/cm²

Pout = output power to antenna in mW

G = gain of antenna in linear scale

Pi = 3.1416

R = distance between observation point and center of the radiator in cm

Pd the limit of MPE, <u>1 mW/cm²</u>. If we know the maximum gain of the antenna and the total power input to the antenna, through the calculation, we will know the distance where the MPE limit is reached.

Results - 802.11b(5.5 Mbps)

Channel	Frequency (Mb)	Average output power (dBm)	Antenna gain (dBi)	Power density at 20 cm(mW/cm²)	Limit (mW/cm²)
Low	2412	15.05	1.9	0.009 86	1
Middle	2442	12.98	1.9	0.006 12	1
High	2462	12.81	1.9	0.005 88	1

Results - 802.11g(12 Mbps)

Channel	Frequency (Mb)	Average output power (dBm)	Antenna gain (dBi)	Power density at 20 cm(mW/cm²)	Limit (nW/cn²)
Low	2412	20.15	1.9	0.031 90	1
Middle	2442	18.69	1.9	0.022 79	1
High	2462	18.61	1.9	0.022 37	1
